Radically transforming our ways of life to reach carbon neutrality: such is the major challenge that we need to take on together before the end of the century. Beyond national commitments by States, local governments and companies invent new ways to build, renovate or manage cities.

The Green Solutions Awards were created by Construction21 to offer them a specific stage to show their achievements, to disseminate these pioneering and innovative solutions to the greatest number of professionals. Our creed? **Inspire thousands of professionals** and incite them to massively adopt more virtuous practices.

**Invitation to the voyage**

The 2017 edition of the Green Solutions Awards takes you on a trip to visit exemplary buildings, districts and infrastructures around the globe. Take notice of buildings located in tropical areas, they demonstrate that conciliating thermal comfort and energy sobriety in hot climates is possible. We salute the arrival of China into the Construction21 network, bringing 15 candidates to this year’s contest. Also, the competition opens to infrastructures, with renewable energies production, sustainable mobility systems, water management and more.

We would like to thank all the candidates, who contribute to the growth of our exemplary projects databases. Thank you also to our juries, media partners and sponsors. The Green Solutions Awards reach every year hundreds of thousand professionals thanks to them.

Christian Brodhag
President of Construction21

Social media dedicated to the sector, www.construction21.org disseminates news and best practices of sustainable buildings and cities for free through 11 national platforms in Algeria, Belgium, China, France, Germany, Italy, Lithuania, Luxembourg, Morocco, Romania and Spain, along with an international platform in English. The Construction21 network, with 1 million visits in 2017, aims to cover the whole world within the 5 years to come.
Since their creation in 2013 by Construction21, the Green Solutions Awards draw more candidates in every year. The 2017 edition counts 150 contestants:

- **118 buildings**
- **11 districts**
- **21 infrastructures**

The prizes reward the winners of **9 categories**, including two Grand Prizes for Sustainable Cities and Sustainable Infrastructures. Competing buildings are divided in 5 categories related to climate challenges and 2 Grand Prizes for outstanding buildings:

- **Energy & Temperate Climates**
- **Energy & Hot Climates**
- **Low Carbon**
- **Health & Comfort**
- **Smart Building**
- **Sustainable Renovation Grand Prize**
- **Sustainable Construction Grand Prize**

Originally, the contest promoted European projects only. Since 2015 and the COP21, other countries joined the competition. This year, contestants come from **19 different nationalities**: Austria, Belgium, Brazil, Burundi, China, Croatia, France, Germany, Italy, Indonesia, Japan, Luxembourg, Mexico, Morocco, Senegal, Spain, Tanzania, the United Arab Emirates and the United States of America.

If those competing buildings, districts and infrastructures are indeed pioneers of sustainable construction and cities, they nonetheless prove that the trend is expanding to all continents: no matter the climate, no matter the local cultures, national politics and policies or awareness within populations… professionals act to inhabit, work and live differently.

The Green Solutions Awards and Construction21 exist to offer these solutions great visibility toward the professional public, to inspire other experts on the web. The contest generates more than 1 million views every year since 2015 and more are expected in 2017 and the years to come.

**Will you embark on this adventure in 2018?**

---

**Urban renewal / Montignies-sur-Sambre, Belgium**

The Cité du Centenaire in Charleroi is a **urban renewal project** and the transformation into an ecodistrict of a 1959 neighbourhood inspired by garden cities. While moving the Cité du Centenaire toward sustainability, this project also had to **protect and rehabilitate an architectural heritage**.

The sustainability approach integrates **ecomobilities** and soft transportation modes, energy efficiency through passive renovations and constructions of housings, the drastic reduction of the district carbon footprint while favouring **social bonding** and interactions within the area.

To limit the environmental impact of the operation, demolition waste was reused and recycled, after sanitizing the buildings from all asbestos. All construction work included as much as possible **recyclable and low emission materials**.

This ecodistrict naturally aims to **respond to its inhabitants' needs** who were involved in the operation from the design phase. Children from the surrounding schools also participated in an art project to dress one of the buildings’ gable. Mineral wool panels were coloured in the many tints collected in the demolished building to offer a genuine testimonial of past lives in the district. This piece of art now gives a **strong identity** to the Cité du Centenaire ecodistrict.

**Project holder:** La Sambrienne  
**Designer:** Startech Management Group
Filtering Gardens® is a biotechnology developed by Phytorestore. It uses humid ecosystems and phytoremediation to clean up waters and make them reusable again while recreating natural green spaces. These filtering gardens are made of a series of pools filled with special substrates topped with local plants. These plants are carefully selected. Grey and rain waters flow through the substrates and the biological interactions of the roots treat the waters, without any addition of chemical, bacteriological, biological nor artificial compound. The efficiency of the process relies only on natural properties and human knowledge of that process. Thanks to this process, sewage networks receive less water to treat. The esthetic result is a lot of green, with a wide range of indigenous species of plants favouring the development of local biodiversity while improving the quality of water in the region and contributing to cooling the microclimate.

Filtering Gardens® is highly replicable and adaptable to a large number of places and it can help the development and protection of their specific biodiversity. It also contributes to raise awareness among the populations on this topic through educative programmes. Its carbon footprint is very low and even generates carbon credits.

Sustainable Infrastructure Grand Prize Winner

**FILTERING GARDENS®**

**Sustainable Infrastructure Grand Prize Winner**

**3 questions for VALÉRIE DAVID,**
Director of Innovation and Sustainable Development

1 - Why did you decide to support the Green Solutions Awards?

Open innovation becomes strategic for major groups who are used to innovate from inside. By opening to other actors and creating a win-win ecosystem, our position on the market is accelerated and we respond better to the emerging B-to-B and B-to-C needs. Environment and sustainable development accelerate the transformation of our economic model of products “bought, consumed, thrown away” toward circular economy and services. Eiffage believes and promotes internal innovation and open innovation, as part of the company’s DNA. Two funds were created by Eiffage in January 1st, 2017 to accelerate the access to the markets for innovations. For the same reasons, Eiffage supports Construction21, a dissemination tool for our sector’s innovation, by sponsoring the Grand Prize dedicated to Sustainable Infrastructures in the Green Solutions Awards.

2 - What are, for your company, the main challenges related to the fight against climate change?

Everyone agrees that public works, construction and transports are enormous consumers of materials, energy and fossil fuels. The news reminds us on a regular basis: increase of climatic variations and exceptional weather events, fight against floods and rise of the seas, exceptional draughts are the more and more visible consequences of climate change. We are aware of these strategic challenges for the planet and Eiffage is convinced we are at the core of the solutions.

3 - What are your solutions, in your field, to face these challenges?

From 2008 to 2012, the work of Phosphore, prospective lab on sustainable cities, gathered the professionals of the Group and outside experts to build new prospectives by imagining challenges by 2030. We collectively imagined and proposed solutions around these 4 priorities:

- Reduce consumption of carbon materials
- Design sober buildings
- Promote transports and energy production methods with less GHG emissions
- Build sustainable cities and responsible, efficient and innovative ecodistricts

The exercise gave us a systemic vision. It also led us to create the High Quality of Life, that guides the design and implementation of the Group solutions at city level (efficient buildings, ecodistricts, eco-mobility solutions, etc.).

[Photo credit: ©A.Meyssonnier]
As an independent international family group in development and construction, Rabot Dutilleul currently counts among the 10 biggest French actors in construction. Founded in 1920, the company developed skills all along the years in complementary sectors related to the construction world, hence gaining almost full control over the real estate chain of value. Rabot Dutilleul cultivates values based on collective performance with nearly 1,750 employees and on long-term relationships with its partners. The Group is present in France, Belgium, Germany and Poland.

3 questions for RODOLPHE DEBORRE, Innovation and Sustainable Development Director

1 - Why did you decide to support the Green Solutions Awards?

The Rabot Dutilleul Group places sustainable development at the core of its strategy, “for real”. We want to provide construction and renovation projects that make territories more environmentally friendly through specific know-how and techniques. Following that spirit, Rabot Dutilleul chose to support the Green Solutions Awards and in particular the sustainable renovation category.

2 - What are, for your company, the main challenges related to the fight against climate change?

Construction does have impacts: energy consumption, greenhouse gas emissions, decline of biodiversity, increase of toxic elements, etc. However, unlike in other sectors like fishery and air transport, solutions exist for most of the issues. We consider it would be a crime not to implement them. Rabot Dutilleul structures its development on a strong environmental approach: design and construction of low energy buildings (BCC), HQE certified projects, C02 assessment of its activities and CSR action plans. This approach allows the Group to renew its offer, while always watching its markets and environment.

3 - What are your solutions, in your field, to face these challenges?

Sustainable construction requires to manage energy efficiency in buildings. Rabot Dutilleul didn’t wait to follow this approach, as many projects can testify, and pushes it further to achieve excellency with the expertise of its Pouchain subsidiary, specialised in electric and climatic engineering. The Group deploys many processes, for example (but there are many others!) to push forward the eco-design in the energy industry, without ever losing sight that the best building is the one in which the occupants feel the best.

Photo credits: Les terrasses de la falaise – Boulogne-sur-Mer
The Barrisol® Normalu® company, founded in 1967, is the world leader of stretch ceiling. It combines tradition, innovation, respect for the environment and technology to offer you the best walls and stretch ceilings.

Our products are rated A+ (very low pollutant emissions) and conform to the highest European and international standards. They are also certified “French Origin Guarantee”. Barrisol® products are 100% recyclable. Our know-how was recognised in 2015 by the label “Living Heritage Company” (Entreprise du patrimoine vivant – a French government label) and in 2014 by the Décibel d’Or, a prize received for our “Acoustic Light®”.

3 questions for JEAN-MARC SCHERRER, Président du Groupe Barrisol® Normalu® SAS

1 – Why did you decide to support the Green Solutions Awards?

Since the foundation of the company, 50 years ago, we became aware of the conservation and respect of the environment. In the heart of the Hardt forest, in Alsace, our head office is surrounded by green areas that we strive to preserve.

Respect for the environment is one of Barrisol’s priorities. Today, it is one of our main vectors to convey our company policy. Participating in the Green Solutions Awards enables us to assert that it is possible to combine tradition with innovation, technology and protection of our natural resources.

Barrisol® system was imagined to use 20 times less raw materials than a standard product. All the Barrisol® sheets and profiles made of aluminium are 100% recyclable. As a member of the English, Canadian and American Green Building Councils, Barrisol® started to commercialise the Barrisol Recycled® line in 2007. We combined innovation and respect for the environment. Recycled® sheets are manufactured from old Barrisol® sheets. We use recyclable materials and encourage our partners and customers to join us in this endeavour.

2 – What are, for your company, the main challenges related to the fight against climate change?

Using fewer natural resources and less energy. The optimisation and the recycling of our products contribute to the reduction of waste.

3 – What are your solutions, in your field, to face these challenges?

We take different actions to preserve the planet, like:

- Setting up a process to recycle old sheets.
- Recycling waste of sheets and aluminium profiles,
- Providing employees with carpool vehicles and shuttles,
- Setting up a waste collection system for recycling.

Installing time switches and presence detectors to ensure proper management of our power consumption.
This positive energy building shelters a supermarket at the ground level and offices on the upper floors. The contractor wanted this project to be exemplary. This was achieved through the combination of mature technologies for a very high level of energy efficiency at a low cost, while providing high resilience and reliability. The thorough energy planning of the building was also key to this project as it integrated all needs of the building, from the systems to the users. Among the solutions implemented in this project, some are worth pointing out:

• An ultra efficient envelope, designed very early in the project,
• An urban heating network fueled by the combustion of waste,
• Low temperature heating floors,
• Ventilation/Cooling systems with adiabatic evaporation,
• Photovoltaic panels on the roof to cover every energy needs,
• The fine tuned building management through a BMS.

Here, the energy performance of the building is not achieved against the user. On the contrary, office spaces were designed to be modular and to adapt to the needs of the tenants. The BMS uses usage and occupation scenario along with sensors to regulate ventilation and heating.

### 3 questions for LOUIS ENGEL, Safety and Sustainable Development Director of PAREX

1 - Why did you decide to support the Green Solutions Awards?

Our Sustainable Development program “Building Responsibly” is based on 4 commitments: innovating for our clients, preserving the environment, taking care of our employees, anchoring our activities locally. These commitments are fully in line with the partnership we have with Construction21, whose contest, the Green Solutions Awards, honours the most innovative solutions in sustainable construction. Convinced that this social media will help to effectively develop and share solutions for a more sustainable construction, we believe it is essential to be one of its partners.

2 - What are, for your company, the main challenges related to the fight against climate change?

The building energy consumption represents nearly a third of the total consumption worldwide and is responsible for almost a quarter of the greenhouse gas emissions.

We believe that all players in the construction chain must be mobilized and we have decided to play our part in this revolution, which is not only a technological, but also a cultural one.

3 - What are your solutions, in your field, to face these challenges?

For several years in France and more recently in the United States, in China, in Spain, in United Kingdom and in Chile, we have taken an active role in improving the thermal efficiency of buildings by developing our External Insulation Finishing System (EIFS) offer. To go further in our commitment to fight climate change, we initiated in 2016, following the Paris Agreement, our Climate Program, a 3-step voluntary approach which consists of:

- Measuring the greenhouse gas emissions by end of 2018 in all countries where we operate,
- Increasing our efforts to reduce these emissions,
- Adapting and mitigating impacts of some residuals emissions by contributing to develop agroforestry programs in 11 countries around the world, close to the communities where we operate.
3 Questions for BRUNO LÉCHEVIN, President of ADEME

Sustainable construction in tropical areas particularly matters to ADEME, so this is no coincidence if we are involved in the Global Alliance for Buildings & Construction launched during the COP21, where we support an “initiative for low carbon buildings in hot and tropical climates”. The Alliance gathers 25 partnered countries to deploy bioclimatic buildings on a broad scale.

This is a crucial challenge as today, more than 40 % of the population lives in intertropical areas, in countries where energy efficiency standards are often inexistent. Hence, we observe excessive energy consumptions, notably because of the use of air conditioning to remedy the heat discomfort.

That’s why we decided to support the creation of a specific category in this contest: one dedicated to energy in hot and tropical climates, to highlight methods, materials and solutions adapted to these specific conditions and to the construction of exemplary buildings.

We are also creating a special MOOC dedicated to sustainable construction under tropical climates. This MOOC will be first and foremost addressed to building professionals from French speaking African countries and from French overseas territories, with a first season scheduled for February 2018.

The ADEME contributes to the implementation of public policies for the environment, energy and sustainable development. To help companies, local governments, public authorities and the general public, our agency provides them with expertise and council.

We also help funding research and implementation projects in all our fields of intervention.

3 Questions for BRUNO LÉCHEVIN, President of ADEME

We are also creating a special MOOC dedicated to sustainable construction under tropical climates. This MOOC will be first and foremost addressed to building professionals from French speaking African countries and from French overseas territories, with a first season scheduled for February 2018.
BPN Paribas Real Estate, subsidiary of BNP Paribas and one of the leading real estate services companies on an international scale, is offering a full range of services that span the entire life cycle of real property: promotion, transaction, advisory, valuation, property management and investment management. With 3,900 employees, BPN Paribas Real Estate offers its clients its knowledge of local markets in 36 countries (16 direct locations and 20 more through its network of alliances that now represents more than 3,200 people) with more than 180 offices.

3 questions for CATHERINE PAPILLON, Global Head of Sustainable Development/CSR

1 – Why did you decide to support the Green Solutions Awards?

The Green Solutions Awards is a contest that takes into account the different topics of sustainable development we are focusing on: social, energy, environmental and economic performance; well-being of occupants; integration of the different types of buildings into the surrounding districts; energy solidarity between buildings, etc.

Furthermore, the Green Solutions Awards highlight concrete and innovative solutions that all the industry can benefit from.

We also particularly appreciate the high standards for the recruitment process of participants, as well as the quality of the jury, which includes real estate experts.

For all these reasons, and because we, BPN Paribas Real Estate, consider it is our responsibility to bring to actors of the real estate sector our vision for the future sustainable city, we support Construction21 and the Green Solutions Awards for the second year in a row.

2 – What are, for your company, the main challenges related to the fight against climate change?

The building sector is responsible for 40% of worldwide greenhouse gas emissions. For this reason, BPN Paribas Real Estate is committed to its stakeholders to integrate climate change issues into its own processes and activities.

Our ambition is to contribute to the development of sustainable cities, by offering products and services that are environmentally friendly, energy efficient and respectful of the health and well-being of its occupants.

3 – What are your solutions, in your field, to face these challenges?

We develop solutions in our different business areas to anticipate and face environmental challenges, but also to respond to the new demands and habits of our clients (whether they are investors, companies, individuals or local authorities). It allows us to play a key role in the urban transition.

As an example, the BNP Paribas Real Estate global business real estate production is environmentally certified. Beyond certifications, BPN Paribas Real Estate provides for the implementation, as part of the Call for innovative urban projects “Réinventons Paris”, with its winning project Ternes, of a connected energy system between offices and housings (smart grids), of a car sharing solutions allowing electric vehicle pooling, and of urban garden terraces, among other solutions.
Ampère E+, a deep refurbishment and restructuration of a 1985 office building, is a breakthrough for smart buildings. This project combines smart technologies, high level energy efficiency and users’ comfort. The multiple certifications for this building are a strong testimonial of its sustainability and innovation: HQE Excellent, BREEAM Very Good, BBC Effinergie Rénovation, Well Core and Shell, Well Interiors, and Cradle to Cradle label.

The intelligence of Ampère E+ resides in how it integrates technologies in an open innovation approach with various technical partners.

The building is smart for its users: the next generation BMS and the mobile application Ampère allow users to control lighting and temperature in their work space. The app also serves as an access pass, a payment system for the company restaurant and shows available meeting rooms.

Ampère E+ is the first building in the world equipped with a system of energy production, management and storage, sharply fitting energy needs and behaviours. The building generates energy through solar panels on the roof and energy recovery on elevators. This energy is then stored in used car batteries, a solution supported by the ELSA European programme (Energy Local Storage Advanced system). The discharged energy represents between 5 and 15% of the building consumptions allowing Ampère E+ to temporarily live off the grid depending on the needs.

Contractor: Sogeprom
Designer: Ateliers 2/3/4/

Consultancy agencies: INEX, Arcora, Peutz, Etamine
Innovation consultancy: Green Soluce

Office building / Courbevoie, France

The CNPC Headquarters is a vast tertiary multifunction complex of 22 floors featuring offices, conference halls, restaurants, sports centres and car parks. It hosts an average of 3,500 people per day. Health and comfort were put at the centre of its design, following the requirements of the Chinese standard: Healthy Building.

This approach is based on the thorough study of 7 factors: air, water, diet, comfort, physical exercise, social interaction and access to services, therefore establishing a very wide definition of health and comfort provided by a building to its users.

Interior air quality of the CNPC Headquarters, a very important matter in China and especially in Beijing, is optimised through a double purification system, both active and passive, coupled with thorough monitoring.

CNPC HEADQUARTERS

Health & Comfort Winner

Office building / Beijing, China

The CNPC Headquarters is a vast tertiary multifunction complex of 22 floors featuring offices, conference halls, restaurants, sports centres and car parks. It hosts an average of 3,500 people per day. Health and comfort were put at the centre of its design, following the requirements of the Chinese standard: Healthy Building.

This approach is based on the thorough study of 7 factors: air, water, diet, comfort, physical exercise, social interaction and access to services, therefore establishing a very wide definition of health and comfort provided by a building to its users.

Interior air quality of the CNPC Headquarters, a very important matter in China and especially in Beijing, is optimised through a double purification system, both active and passive, coupled with thorough monitoring.

Water is also processed and treated through a very efficient purification process.

The well-being of the users of a tertiary building can also be addressed through healthy diet. With 3,500 people working every day in this building, the CNPC decided to provide healthy restaurant services based on the rhythm of seasons, the weather and the principles of Chinese medicine. This healthy diet can be completed with sport activities practiced in dedicated spaces available in that same building.

Green Solutions Awards

www.construction21.org
For 25 years, THEMA is the exclusive importer for Belgium and the Grand Duchy of Luxembourg of thermal equipment from the best European manufacturers: REMEHA (gas), WINDHAGER (biomass), SONNENKRAFT (solar), CORDIVARI (storage tanks), KROLL & MHG (domestic fuel), ICI CALDAIE, etc.

As a family company, THEMA s.a. stands out for its competence and the versatility of its engineers serving engineering consultancy agencies, technical services in administrations and all kinds of installers.

PIERRE COLLETTE,
Chief executive officer

**Why did you decide to support the Green Solutions Awards?**

THEMA is a pioneer in the sector, so we naturally chose to support the innovation contest organised by Construction21. When THEMA s.a. was founded by Pierre Collette in 1989, offering high efficiency and low NOX emissions boilers was not what the market wanted. Two decades later, the challenge is won, THEMA is leader.

**What are, for your company, the main challenges related to the fight against climate change?**

In 2017, the energy sector is mutating. That is because people are more and more aware that reducing our energy needs is vital on the short term for our planet.

The optimal use of non-carbon, alternative and renewable energy from different sources becomes self-evident. In consequence, equipments constantly evolve and technology get sharper and sharper.

**What are your solutions, in your field, to face these challenges?**

We propose full solutions to our customers, from a broad panel of high quality and technically and environmentally innovative equipments (made in Europe). For example, THEMA s.a. designed a multi-energy heating and hot water installation in a jail of 312 convicts. This system includes heat recovery in refrigeration units, electricity production by cogeneration and heat production through 160 square meters of solar panels.

We also assist our customers in choosing products, with technical documentation, by studying the project before installation, training and product support.
In 2017, 150 buildings, districts and infrastructures from all 5 continents and all latitudes competed for the Green Solutions Awards. 19 countries were represented.

Contest powered by the national chapters of the network
