

Timber/Straw Passive residence Jules Ferry

by Antoine Pagnoux / 2014-02-19 14:59:05 / France / 23079 / FR

Building Type : Collective housing < 50m
Construction Year : 2013
Delivery year : 2013
Address 1 - street : rue du 10ème BCP 88100 SAINT-DIE-DES-VOSGES, France
Climate zone :

Net Floor Area : 2 707 m² Other
Construction/refurbishment cost : 4 265 000 €
Cost/m² : 1575.54 €/m²

Certifications :

General information

homes Jules Ferry: 2 buildings housing 26 apartments counting T3 (75m Â²) and T4 (90m Â²) .

Sustainable development approach of the project owner

The will of the entire team project owner and mastery of work was to realize a transaction with the lowest impact on the environment with:- Use of bio-materials sources mainly (wood, straw, ...)- Have a building that manages the most independent manner possible and low maintenance- Use of free and renewable energy (solar, geothermal, heat recovery on ventilation and greywater lift REGENERATIVE ...)The costs of energy and loads of achievement are as low as possible for tenants:- Passive construction- Equipped kitchen oven and hob Induction Class A +- Equipped showers taps a button ...

Architectural description

The project consists of 2 buildings which volumetrie provides architectural and urban integration by progressive hierarchization of the Crees and recovery volumes neighboring volumetrics. The use of vernacular materials (red clay and wood) contemporary manner can present strong facades.

If you had to do it again?

Without hesitation. The total of 26 housing instrumentation and energy system provide real-time consumption and parameters of the entire project. We have found that we reach widely expected level of performance.

Energy

Energy consumption

Primary energy need : 37,00 kWh/m².an

Primary energy need for standard building : 75,00 kWh/m².an

Calculation method : RT 2012

Breakdown for energy consumption : Heating: 10 KWh/m² / m² ECS: 10 Ventilation: 10 Lighting: 5 Auxiliaries: 2

Real final energy consumption

Final Energy : 40,00 kWh/m².an

[Building Compactness Coefficient](#) : 0,50

[Indicator](#) : n50

[Air Tightness Value](#) : 0,30

[🔗 Rapport test AvNR](#)

More information

The actual consumption is much lower than the RT2012 calculation, the higher the coefficient of EP / EF passage 2.58 is not relevant here because the vector electric energy supply is 100% renewable energy is a primary factor tending to 1

Product

Structure Wood and Straw Insulation

Product category : Structural work / Structure - Masonry - Facade

The constructive principle is based on panels of solid wood laminated spruce. They constitute the envelope and floors of the project and remain largely apparent in the interior of the apartments. The external insulation is composed of prefabricated boxes filled with straw. Particular attention was paid to the elimination of thermal bridges: fixings out of the straw bridge, triple glazing joinery isolated.

Constructive advantage of wood and straw:- The wood is light, the vibrating masses sought are weak and seismic forces are less important than a massive concrete structure. Tests show a behavior when earthquake very favorable: dissipation of energy in many assemblies.- The structure of wood for a fire, has its charred outer layer protects the heart and then the structure that retains its mechanical strength. (Conversely, the metal heats quickly loses its bearing capacity). The straw, in the absence of oxygen (in boxes) and slowly carbonized also protects the bearing structure for more than one hour. Its insulation properties and phase shift are a temperature of 900 Å° C on one side of the boot takes 20 minutes increase by 1 Å° C on the other side. This is a very large protection against fire.- A quick and healthy worksite clean. Prefabrication and method of construction filiere dryer allows to realize a cleaner, faster site (no drying time). The use of bio-materials sources significantly reduces health risks for workers and residents.

Box of simple and economic straw

Product category : Finishing work / Partitions, insulation

Filling prefabricated insulated boxes with the help of simple boots agricultural straw, economic and particularly renewable material. Please note: the entirety of used straw (10 hectares) shall be renewed within one year. Shop fabrication and delivery to site. Mounting boxes directly on the solid wood and use as carriers of the larch cladding battens and terracotta structure.

Carbon balance of positive construction of 1 100 tonnes of Co2!- 1000 T C02 stored in 1,000 m3 of wood used- 200 tonnes of CO2 stored in the 600 m3 of straw used- 100 tonnes of CO2 consumed during construction For comparison, the construction of the same building classical solution (concrete / polystyrene / PVC) would have resulted in a negative carbon balance 600 tonne of C02, or the equivalent of 50 years of heating and hot water to this building if using gas or 6,000,000 km traveled by a recent car! Mastering the use of C02 during construction not to burn a few months several decades of energy needs is an excellent preamble to the construction of a simple and efficient building.

Panneau bois contrecollé KLH

KLH - Lignatec

contact@lignatec.fr

<http://www.lignatec.fr>

Product category : Structural work / Structure - Masonry - Facade

Panneau structurel en bois contrecollé KLH. Le panneau est employé ici en façade, refend et plancher intermédiaire. Il reste apparent sur certains murs et en sous face de plancher. Le panneau KLH est support de l'isolant paille qui est directement vissé par l'extérieur. L'épaisseur des murs diminue en fonction de l'étage. Le panneau apporte sa légèreté et sa rigidité pour répondre aux efforts de vent et sismiques. Temps de pose de l'ensemble de la superstructure : 3 semaines.

légèreté, rigidité, utilisation en zone sismique, précision usinage, étanchéité à l'air, possibilité de le laisser apparent
