

## Waste House

by [Duncan Baker-Brown](#) / 2018-06-15 18:57:24 / Internacional / 11825 / EN

**Building Type** : School, college, university  
**Construction Year** : 2013  
**Delivery year** : 2014  
**Address 1 - street** : 58–67 Grand Parade BN2 0JY BRIGHTON , United Kingdom  
**Climate zone** : [Cfb] Marine Mild Winter, warm summer, no dry season.

**Net Floor Area** : 85 m<sup>2</sup> Superficie útil  
**Construction/refurbishment cost** : 250 000 €  
**Number of Pupil** : 25 Pupil  
**Cost/m<sup>2</sup>** : 2941.18 €/m<sup>2</sup>

### General information

The Brighton Waste House is the first permanent 'carbon negative' public building in Europe to be constructed from approximately 90% waste, surplus material & discarded plastic gathered from the construction and other industries, as well as our homes. It has Full Planning & Building Regulations Approvals. It tries to prove "that there is no such thing as waste, just stuff in the wrong place!"

About 65% of the waste material utilised in this building is from the notoriously wasteful construction industry (around 20% of construction material ends up in landfill-WRAP). However the idea was developed further with Cat Fletcher founder of FREEGLE UK. Cat suggested the we draw attention to the huge environmental consequences of throwing away everyday consumable domestic objects, as well as including other industrial waste streams in the project. Therefore the Waste House also 'locks' other sources of waste material, often utilising it as low to medium grade insulation.

One of the main aims of the project was to prove "that there is no such thing and waste, just stuff in the wrong place". It is also an exercise in truly open accessible collaborative design and construction. This innovative low energy building was constructed completely by over 360 students & volunteers as young as 15 years old.

The project continues a line of research by BBM considering truly sustainable sources of materials and construction systems, or to be more precise truly 'circular metabolisms' that will one day help create a 'Circular Economy'. Baker-Brown's experience on this project has enabled him to write a book 'The Re-Use Atlas: A designers guide towards a Circular Economy'.

#### If you had to do it again?

We wouldn't do it again. The Waste House is a 'polemic', a thought-provoker and awareness raiser. In many ways it's job has been done and many more people are aware about the issue of waste in relation to humankind's consuming focused, throwaway lifestyles. However what we would like to replicate in the fully inclusive pedagogic mode utilised.

The Brighton Waste House started out as a design-and-build project, as well as an inclusive learning process to prove that construction waste and surplus material was worth salvaging and not throwing away. Via further research and a policy of inclusive design, the project evolved into more of a polemic rather than an exemplar for the UK housing industry to copy. The Waste House is a vessel containing hundreds of stories associated with the salvaged materials it contains. These stories and narratives resonate through the building and ensure that students, consultants, academics, and whoever asks questions when they use the building, will know more about where stuff comes from and where it normally ends up. Then, perhaps, they might ponder how things might be done differently: how our unintelligent 'linear economy', which finds material, then processes it into things that we then throw away, could be changed into a 'circular economy' where materials and goods are in a state of perpetual reuse.

The Waste House acquired more than 40 partners during its development. Many of these partners are able to use the building. Schools visit the Waste House and take part in sustainable design workshops with designers, poets, writers, artists and constructors. The University of Brighton's MA in Sustainable Design is based in the building, and many community groups use it as well.

The unusual external fabric of the building is being monitored to see how it performs compared with more straightforward materials. This information will be published in due course.

Over 450 articles have been published around the world via newspapers, web-based magazines, TV and radio. This project has got people speaking about waste as a valuable resource. To date it has won ten awards and is currently nominated for five more. It appears to have struck a chord.

The Waste House still inspires student on campus as new generations are encouraged to add their design ideas to the building. It is an ongoing, 'live' research project. The team, comprising different academic and vocational establishments, the local authority and local contractors, are currently bidding for European grants for future collaborative, innovative construction projects, and the idea of a 'Live Projects Office' is a reality for the Faculty of Arts and Humanities.

#### Building users opinion

The Waste House is an ongoing research project, involving new generations of students being set projects testing, improving and updating the house, whose performance is being constantly monitored by the University of Brighton's School of Science and Engineering. Since the inception of the Waste House in 2010, the University of Brighton has hosted a website focusing on its development, from an idea through to completion. It is regularly updated and serves as an archive and learning resource.

The themes and challenges embraced by the Waste House have influenced the core curriculum of the undergraduate architecture and interior architecture

courses at the university, as well as at partner institution City College Brighton and Hove. I coordinate architecture 'technology' and 'practices' modules, which use the process of designing and then constructing the Waste House as an inspiration, awareness raiser, and vehicle to deliver RIBA-approved learning outcomes. Architecture students have considered design projects tackling issues associated with valuing waste as a resource, as well as broader issues relating to the circular economy. One undergraduate architecture student designed a timber construction system that inspired the 'cassettes' used in the Waste House. Construction students from City College completed learning modules of their carpentry, electrics, plumbing, brick laying, plastering, decorating and maintenance by working initially in the workshop, but then crucially on the 'live' construction site. Cat Fletcher and I delivered lectures to City College construction students, as well as architecture students, as part of their core curriculum. We also gave presentations about waste and designing for a circular economy to children. As part of the University of Brighton's ongoing Widening Participation Programme, over 750 young people were shown around the construction site during the construction period.

The Waste House has served as an inspiration for many visiting students from regional tertiary colleges, as well as students from the university's School of Science and Engineering. Indeed, while on site a Jordanian PhD student approached the university asking if he could be involved in the digital monitoring of the external wall fabric. He moved to the UK to do just this. The Waste House also hosts regular school visits on Wednesdays, where open design workshops are held.

In March 2013 Nick Gant and Baker-Brown curated a three-day seminar entitled 'The WasteZone' as part of EcoBuild 2013. Twelve guest speakers discussed the idea of waste as a valuable resource from many different perspectives. The Waste House team also designed and erected the 9m-tall 'waste totem', drawing the attention of the 65,000 visitors towards issues of reuse. Since this event, a new reuse-themed zone, called 'Resource', has been launched at EcoBuild. We feel we may have played a small role in enabling that to happen.

The Waste House also hosts the University of Brighton's Sustainable Design MA, with students working in the first-floor studio two days a week. Prof Jonathan Chapman and Nick Gant have their office on the ground floor. Community groups, local schools and other educational establishments, as well as local and international businesses and local authority groups, use the Waste House. The building hosts meetings, lectures and symposia with large construction contractors as well as commercial enterprises such as The Body Shop and Marks & Spencer.

Perhaps the biggest legacy the Waste House project leaves is that of raising awareness of the negative issues associated with society's linear, throwaway, consumer-led lifestyle. The building has many stories associated with the materials collected and residing within it. For example, an airline cabin-service company at Gatwick Airport collected 25,000 plastic toothbrushes for the project in only four days. These statistics stop you in your tracks, as it were, and get you thinking about where 'stuff' comes from and where it currently ends up. Perhaps it will also encourage more people to realise the potentials for reuse and, more particularly, the potential for designers to play a huge part in our future circular economy, and, of course, to understand that 'there is no such thing as waste, just stuff in the wrong place'.

## Energy

### Energy consumption

Primary energy need : 22,50 kWhpe/m<sup>2</sup>.year

Primary energy need for standard building : 85,00 kWhpe/m<sup>2</sup>.year

Calculation method : Other

CEEB : 0.0003

Breakdown for energy consumption : Metered electricity 1/5/14 – 29/1/15 2388 kWh

Annualised metered electricity 3200 kWh

Annualised PV used on site 500 kWh

Total Annual electricity use 3700 kWh

This can be subdivided:

Annual heating and hot water 500 kWh	= 29.4 kWh/m <sup>2</sup>	= 1293 kgCO <sub>2</sub> pa	= 15.2 kgCO <sub>2</sub> /m <sup>2</sup>
--------------------------------------	---------------------------	-----------------------------	--

Annual other electrical use 1200 kWh	= 14.1 kWh/m <sup>2</sup>	= 620 kgCO <sub>2</sub> pa	= 7.3 kgCO <sub>2</sub> /m <sup>2</sup>
--------------------------------------	---------------------------	----------------------------	---

Metered PV generation 1/5/14 – 29/1/15 3809 kWh

Annualised PV generation 4200 kWh	= 49.4 kWh/m <sup>2</sup>	= 2171 kgCO <sub>2</sub> pa	= 25.5 kgCO <sub>2</sub> /m <sup>2</sup>
-----------------------------------	---------------------------	-----------------------------	--

Assumed PV electricity used on site 500 kWh

### Envelope performance

Envelope U-Value : 0,20 W.m<sup>-2</sup>.K<sup>-1</sup>

More information :

See attached document presented by Robinson Associates

### More information

This building currently creates approximately 30% more electricity than it consumes

### Real final energy consumption

Final Energy : 22,50 kWhfe/m<sup>2</sup>.year

Year of the real energy consumption : 2 015

### Systems

#### Heating system :

- No heating system

#### Hot water system :

- Individual electric boiler

#### Cooling system :

- No cooling system

#### Ventilation system :

- Double flow heat exchanger

#### Renewable systems :

- Solar photovoltaic

Renewable energy production : 130,00 %

#### Other information on HVAC :

We have a domestic MVHR system by Vent Axia

## Environment

### Urban environment

The existing East wing of the Grand Parade Faculty of Art campus forms the Northern boundary of Brighton Waste House (BWH) site. The Western boundary is also defined by existing buildings. However the South & East boundaries are currently enclosed by an existing 2.4m high chain link fence and matching opening gate.

The site in the northeast corner of the Faculty of Arts' Grand Parade courtyard has access from the courtyard, and from William Street, running directly off Grand Parade. A sign hanging out from the building, and temporary installations on the green in front of the Grand Parade building, both designed by Brighton students (in the manner of the temporary constructions outside the Serpentine Gallery in London), would alert the public to the whereabouts of the entrance on William Street, thereby keeping public access and university access separate. A simple division of the ground floor of SUS into a campus side and a public side would allow access to the building at different times for different users.

TREES: There are no trees near or adjacent to BWH site. There are however substantial trees in the courtyard enclosed to the North East of the plot.

HARD & SOFT LANDSCAPING: We are suggesting a hardwood timber deck forming the entrance route off Grand Parade Mews. The grass lawn to the East and North of BWH will be kept as existing.

SITE ACCESS: BWH is positioned on South East corner of the Grand Parade campus so that it can be accessed by pedestrians, when necessary, directly off Grand Parade Mews (an un-adopted road off William Street) when the University buildings are closed. When the Faculty of Art buildings are open THTKB can be accessed off Grand Parade via the central landscaped courtyard.

HARDSTANDING FOR CARS: There is no provision for additional car parking on site.

ACCESSIBILITY: BWH is accessed from its new front doors on the South elevation via a level threshold.

WC facilities can be found in existing Faculty of Art buildings on campus. All fully in accordance with the stipulations of the **Disability Discrimination Act**.

TRANSPORT LINKS: BWH is under two minutes walk from bus services running into the town centre and beyond. Shops are within walking distance. Brighton town centre is 5 minutes walk away from the site.

Land plot area : 320,00 m<sup>2</sup>

Built-up area : 50,00 %

Green space : 20 000,00
